SMOOTHWALL SILOS

'Aylsham' Smoothwall Round Silos form part of a fully integrated system designed to store grain, pellets, soya and other difficult to flow meal type products.

Ranging in sizes from 3 metres to 9 metres diameter in 1½ metre increments, with wall heights to 15 metres they are available with integral suspended hoppers, or on steel entablature with hoppers bottoms. Outlets can be adapted to take all forms of discharge aids and hopper angles varied to suit individual specifications.

'Aylsham Smoothwall Silos', supplied for on-site assembly are suitable for indoor and outdoor locations either in single or multiple formation. Designed to DIN 1055 standards they are weatherproof, vermin resistant, and comply with most international codes of practice for steel silo requirements.

Each enquiry and its application is carefully analysed and computer calculations take into account materials, density, angle of repose and climatic conditions. The fully sealed wall sheets are roll-formed from varying gauges of galvanised sheet steel and vertical seams overlapped.

Complementary ranges of ancillary equipment are available including ladders, catwalks and access doors to complete the system, designed specifically to meet the exacting specifications demanded by the food and feed industries.
